

ANDREI RAUL LĂPUȘTE

DETAILS

ADDRESS
Florești, Cluj County
Romania

PHONE
0745815026

EMAIL
raul.lapuste@yahoo.com
raullapuste1@gmail.com

DATE OF BIRTH
09.01.2000

DRIVING LICENSE
Yes

NATIONALITY
Romanian

SKILLS

Git
SQL
ASP.NET Core
C#
C++
C
HTML & CSS
JavaScript
Java
React

EMPLOYMENT HISTORY

Front End Developer, Endava SRL Cluj-Napoca
Jul 2022 — Sep 2022

- Provide front-end support using React, coordinating with .NET back-end and managing Firebase-driven data workflows

QA Analyst, Quantic Labs Cluj-Napoca
Mar 2025 — Apr 2025

- Functional testing of games on multiple platforms (PC, consoles, mobile phones) to identify bugs, game errors and performance issues
- Writing and updating bug reports in bug tracking systems (e.g. JIRA, TestRail, Bugzilla), using clear descriptions and exact reproduction steps

Inginer Automatist, Seratel Electronics SRL Cluj-Napoca
Jul 2025 — Nov 2025

- Design, test, install, and maintain electronic scoreboards and advertising display systems. Occasionally, I serve as a Video Assistant Referee for sports competitions, including swimming and polo, providing video review support to ensure accurate, fair decisions and maintaining reliable replay systems during events

EDUCATION

Master Degree in Automation and Software Programming, Technical University of Cluj-Napoca, Oct 2024 Cluj-Napoca

Bachelor Degree in Automation and Software Programming, Technical University of Cluj-Napoca Oct 2019 — Oct 2023 Cluj-Napoca

AutoCad

Software Design

Matlab & Simulink

JMeter Testing

Selenium Testing

RabbitMQ

MQTT

Flutter

PROFILE

During my studies, I developed solid programming and engineering fundamentals—ranging from OOP design and web development to process modeling and control—and applied them in a variety of solo and team-based projects, including:

- **Banking system with Java**
- **Car dealership website with React and MS SQL**- my role in this team project was to create a database, writing queries, making an ASP.NET API using C# and creating React components
- **IoT Controlled Device (C#, .NET Framework)** – Engineered a .NET API with a non-volatile caching system to optimize data handling between the interface and database. Built a responsive Windows Forms application for user control and deployed the API on Microsoft IIS for local network connectivity
- **Artificial Muscle Using Shape Memory Alloy (SMA)** – Bachelor's project exploring the unique thermal-actuated properties of Nitinol alloy to generate controlled mechanical movement.
- **Pan-Tilt Camera(Arduino, ESP32-WROOM, ESP32-cam)**- Built a compact pan-tilt camera using ESP32-WROOM and ESP32-CAM modules, with servo-driven motion, Bluetooth control, and I2C integration via AS5600 magnetic encoders
- **Face detection system using PyTorch(Python)**- designed to work with image data captured by an ESP32-CAM module. The camera streams video frames at a fixed low resolution, optimized for real-time performance and limited hardware resources. All frames are processed on a host computer, where they are resized to match the camera output and converted to grayscale to ensure consistency between training and inference.
- **Text detection system using Pytorch(Python)**- A convolutional neural network (CNN) designed for recognizing digital characters, subsequently used for analyzing and reconstructing handwriting extracted from images.
- **Messaging web application(C#, SQL, React)**- Application created for communication between company staff, preferred for sending and receiving emails, capable of sending externally to customers or for creating user-generated reminders. Users must follow the account creation form for access. Ability to change password. Access control. Working period control and information backup in case of server failure.
- **Menu optimization program (Java, Swing, Evolving algorithms)**
Darwin's evolutionary theory was developed into an advanced search process that starts from non-zero values and goes through validation, reconstruction, and advancement processes. This program applies these ideas to search through a massive set of 7.9×10^{108} different combinations to find the best one to satisfy a set of rules. The app works with 34 foods, listing their calories, price, vitamins, and minerals, each measured per 100g of product.
